**Cyril Jarman : Plant Fibre Processing: A Handbook (Small-Scale Textiles Series)** before purchasing it in order to gauge whether or not it would be worth my time, and all praised Plant Fibre Processing: A Handbook (Small-Scale Textiles Series):

This book covers the pre-spinning processes which make plant fibres suitable for textile manufacture. It includes not only familiar plant fibres such as cotton, sisal and jute, but also less well known fibres from plants such as Himalayan nettle, pineapple leaf and kenaf, which are of great value to small communities where they are used for both utilitarian

and decorative purposes. As well as extraction and other pre-spinning processes, there is background information on the growing areas, soil and climatic requirements and methods of harvesting, and details of equipment suppliers and sources of further information.

"This handbook presents no-nonsense introductory information for those working to help the rural poor in developing countries generate income. Almost every tropical and sub-tropical vegetable fiber (hemp to abaca) for rope, twine, and baskets. Learn about extraction, grading and processing. Includes elegant drawings and access information for equipment suppliers in the Philippines, India, Columbia, Northern Ireland, and the UK, and ag-research organizations in a dozen countries." (Whole Earth Magazine)
